

Email Automation Systems Explained

How both the Amharic and Tigrinya sign-up forms work, end to end.

Finance 1-0-1 runs two parallel, independent email systems -- one for the Amharic-speaking sign-up form, one for the Tigrinya-speaking sign-up form. Both work the same way structurally: someone signs up, gets an immediate welcome email, and then a weekly reminder every Sunday -- with a working one-click unsubscribe in every email. This document explains both.

System 1 — Amharic Finance Form

How It Works

Trigger	What Happens
Form submitted	onFormSubmit fires instantly -> sends the Welcome email.
Every Sunday, 9am	sendWeeklyEmails fires -> sends the Weekly reminder to everyone who hasn't unsubscribed.
Unsubscribe link clicked	doGet (Web App) flags that person -> they're skipped from all future weekly emails.

Where the Message Content Lives

All wording lives in a sheet tab called **Message_Config** (columns: Type | Subject | Body), not in code -- edit any message anytime without touching the script. One row has **Type = Welcome**, another has **Type = Weekly**.

```
Type | Subject | Body
Welcome | Finance 1-0-1 | Hi {{name}}, ...
Weekly | Weekly Training... | Hi {{name}}, ...
```

{{name}} is replaced automatically with the recipient's first name.

The Functions Involved

- **onFormSubmit** -- fires when the form is submitted, sends the Welcome email, records that it was sent.
- **sendWeeklyEmails** -- fires every Sunday at 9am, sends the Weekly email to everyone not unsubscribed.
- **markSent** -- helper that stamps a "YES" in the tracking column once an email goes out.
- **doGet** -- handles clicks on the unsubscribe link (requires the Web App to be deployed).
- **setup** -- run once to install both triggers together. Safe to re-run anytime; it only clears its own previous onFormSubmit/sendWeeklyEmails triggers first.

Unsubscribe Flow

Every email ends with a link like `...?token=xxxx`. Clicking it hits the deployed Web App, which finds that row by its unique token and sets **Unsubscribed = TRUE**. From then on, that person is skipped from every future weekly send -- permanently, with no further action needed.

System 2 — Tigrinya Finance Form

This is a separate, independent sign-up form and script -- same overall design as the Amharic system, but function names were kept distinct on purpose so the two systems can never accidentally interfere with each other.

How It Works

Trigger	What Happens
Form submitted	sendThankYouEmail fires instantly -> sends the Thank You email.
Every Sunday, 9am	sendWeeklyReminder fires -> sends the Weekly reminder to everyone who hasn't unsubscribed.
Unsubscribe link clicked	doGet (Web App) flags that person -> they're skipped from all future weekly emails.

Where the Message Content Lives

Wording lives in a sheet tab called **Message_Content** (columns: Type | Subject | Body). One row has **Type = ThankYou**, another has **Type = Weekly**.

```
Type | Subject | Body
ThankYou | Thank you for your response! | Hi {{name}}, ...
Weekly | Finance 1-0-1 | Hi {{name}}, ...
```

The Functions Involved

- **sendThankYouEmail** -- fires when the form is submitted, sends the Thank You email.
- **sendWeeklyReminder** -- fires every Sunday at 9am, sends the Weekly email to everyone not unsubscribed.
- **doGet** -- handles clicks on the unsubscribe link (requires the Web App to be deployed).
- **setupFormTrigger** / **setupWeeklyTrigger** -- install each trigger individually, if you ever want to reinstall just one.
- **setup** -- run once to install both triggers together in one step. Safe to re-run; it only clears its own previous sendThankYouEmail/sendWeeklyReminder triggers first.

Unsubscribe Flow

Identical mechanism to the Amharic system: a unique token per person, a Web App endpoint that flags their row on click, and permanent exclusion from future weekly sends once flagged.

Both systems share the same visual design (navy header, teal divider, clean white card) so every Finance 1-0-1 email looks consistent regardless of language. Neither system can interfere with the other -- they use separate sheets, separate scripts, and separate function names throughout.
